Locking your old computers and drives in a locked cupboard is secure right?

WRONG!!!

Old tech that is stockpiled leaves you vulnerable.

If there's personal information stored on them, you could be unwittingly breaking information privacy laws.

Stored in an IT cupboard, or offsite, confidential information stored in hard drives in computers and laptops, back-up storage and other electronic media is the target of data thieves.

Data that you erase, reformat, or wipe can be restored.

Erasing Drive data is not always 100% safe, no matter what the software promises.

Data may remain intact. Information thieves can easily restore any data you thought was destroyed completely.

Incorrect destruction can lead to costly breaches.

Confidential information, stored in any format, is putting you and your organisation at risk of a security breach and liability.

A data security breach can cost an average of $3.36 million to Australian businesses annually, which is a 20% increase in the last 5 years*.

Why put your company at risk?

Destroying your old drives and e-media is a smart decision and a extremely minimal business cost when compared to the potential risks and costs to you and your business reputation when you don't.

Mosaic IT will provide a solution that will fit your budget.**

Destroying a hard drive is an effective way to permanently render its information inaccessible.

Mosaic IT with its partners, makes sure any confidential information on drives or e-media that is redundant cannot be retrieved by physically destroying them.

The destroyed hard drives are then completely recycled.

*Ponemon Institute LLC/IBM, 2014 Cost of a Data Breach Study: Australia comparted to February data by DNX Solutions.

**Customers may be required to remove hard drives from equipment prior to collection by Mosaic IT.
